Abstract

The existence of human being depends on the availability of various types of food and the ability of providing food resources. Providing food human based on this providing food which is a crucial issue a human being seek to have using it may take all efforts and knowledge.

Historically and specifically in agricultural traditional societies human work food problem in frame consisting of human effort and nature valuables.

Nowadays, the permanent increase in population especially of developing countries made the issue of providing food a major problem may take a lot of efforts.

This research focuses on the population and the nutrition situation in Syria during 1990-2004; it takes of three basic lines:

The first factor deals with population, labor work, force labor. This study considers demographical part.

The second factor examines the analyses of the reality of agricultural sector in Syria as the main source of food.

This third factor, studies nutrition safety in Syria and the problem of nutrition gap. Therefore, to provide and understand the nature of nutrition situation in Syria we should know to what the extent food producing sector responds to the varying demands.
