Abstract

This research highlights the reality of spatial distribution of population in Syria and the factors affecting and affected by this pattern of distribution, through using some of demographic measures and indexes that describe the population distribution features in Syria which allows us to understand the population distribution patterns in Syria and predict many demographic phenomena and understand the population variables.

These measures are: percentage of population concentration, Lorenz curve, the quantitative gravity of population, and that all the problems faced by the spatial distribution of population and developing appropriate solutions and influencing the future; because, lack of planning led to the emergence of a clear imbalance between population and development in the provinces; therefore, this study considered as a main perspective in developing programs and social development plans nationwide
